Jarren Duran

Bats left · 2026 · 607 PA · xChase+ 68, 258th of 261

Swings at 34% of pitches outside the zone. Hitters on average swing at 29% of the same pitches.

COST OF FAR-OFF CHASES

4.6

runs per 600 PA from your choices on pitches 4+ inches off the plate

What to work on

1. With two strikes, mostly against right-handers, let breaking balls below the zone go. You swung at 52% of them; hitters on average swing at 41%. The ones you swung at were typically 8 inches off the zone. You miss on 60% of your chases, against 47% for other hitters on the same pitches: contact is your bigger cost, so this one is a take even when you could reach it. — leak 1

2. When you're ahead, mostly against right-handers, let breaking balls below the zone go. You swung at 69% of them; hitters on average swing at 33%. The ones you swung at were typically 6 inches off the zone. — leak 3

Keep swinging at strikes. The only changes on this card are the pitches above.

TARGET

No chase target: leaks 1 to 3 together were 7 points above the league's chase rate in 2026, and with no change should be about at it in 2027. The number to move is contact on chases.

Where you chase, all pitchers

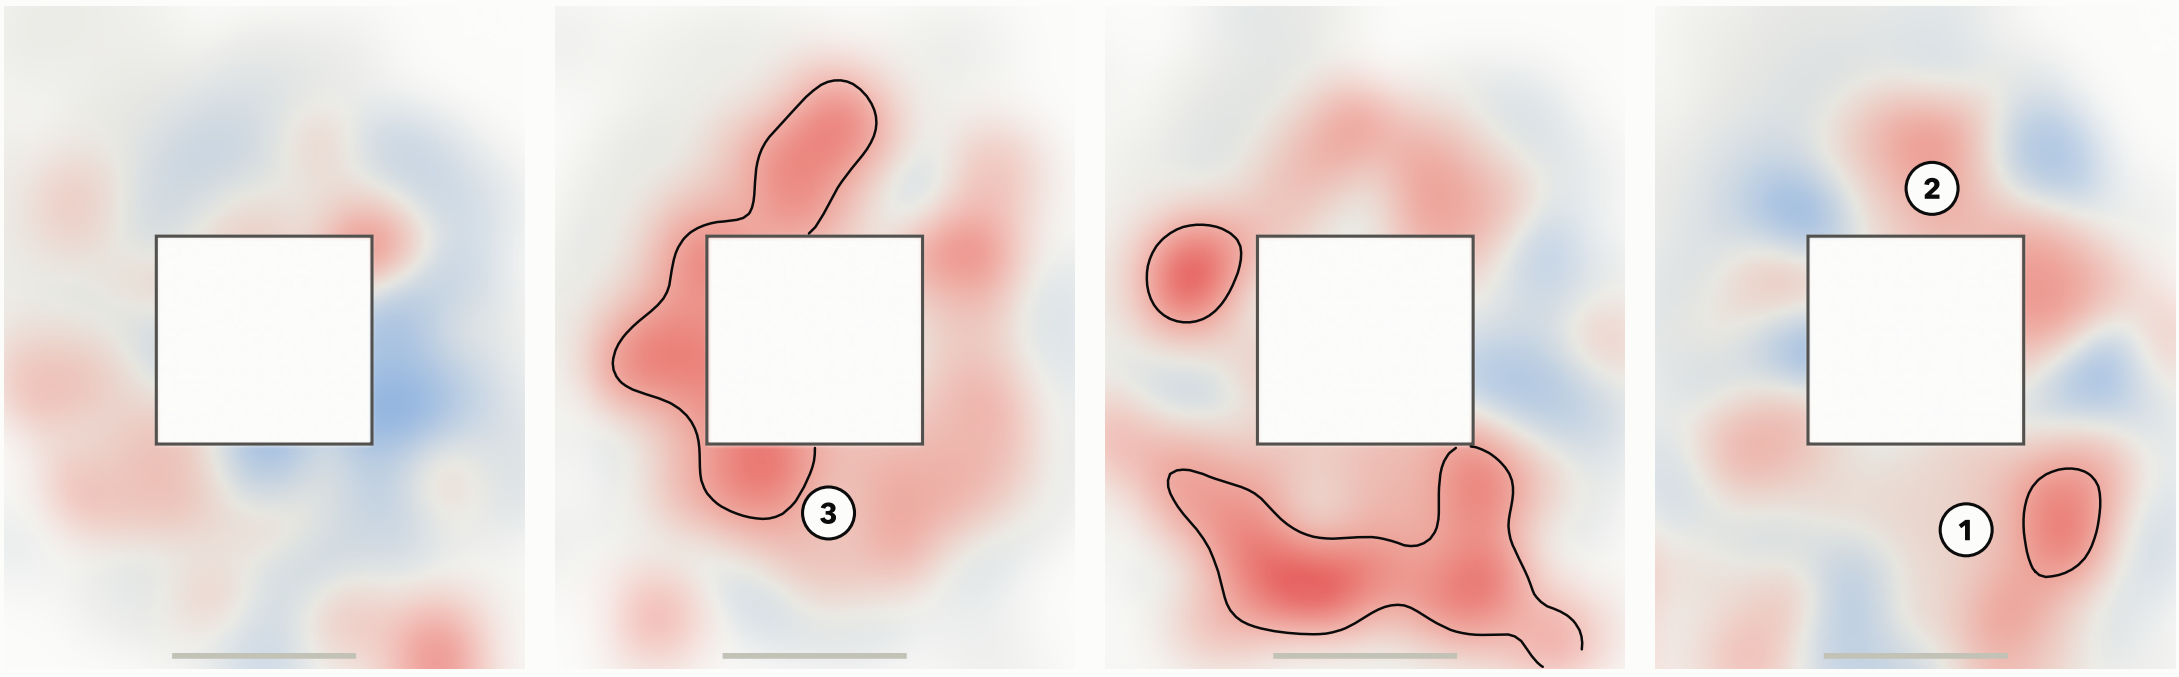

red: more than the average hitter at that spot and count; blue: less

Biggest leaks

numbered on the pictures · runs per 600 PA

1	Two strikes, mostly vs RHP, breaking balls below the zone	52% vs 41% · 36 of 69	**−2.0**
2	Two strikes, mostly vs RHP, fastballs above the zone	53% vs 47% · 40 of 76	**−1.0**
3	Ahead in the count, mostly vs RHP, breaking balls below the zone	69% vs 33% · 9 of 13	**−1.0**

You vs the average hitter on the same pitches; the runs are what the swing choices cost. Ranked by runs; the plan takes up to two, in the order to work on them.

Far-off chase rate by season

Pitches at least 4 inches off the plate: you against every hitter.

Chases vs the average hitter, same spot and count

−30 pts league +30 pts

Blue: you take more. Red: you chase more. Gray: about average.
White: too few pitches to say. Outline: 15 points or more.

Does fixing a leak pay? Hitters who cut their leak chasing more than expected stopped giving counts away: more walks, no more strikeouts, still swinging at strikes. The gain was mostly runs not lost; hits come later, if they come.

How to read your card

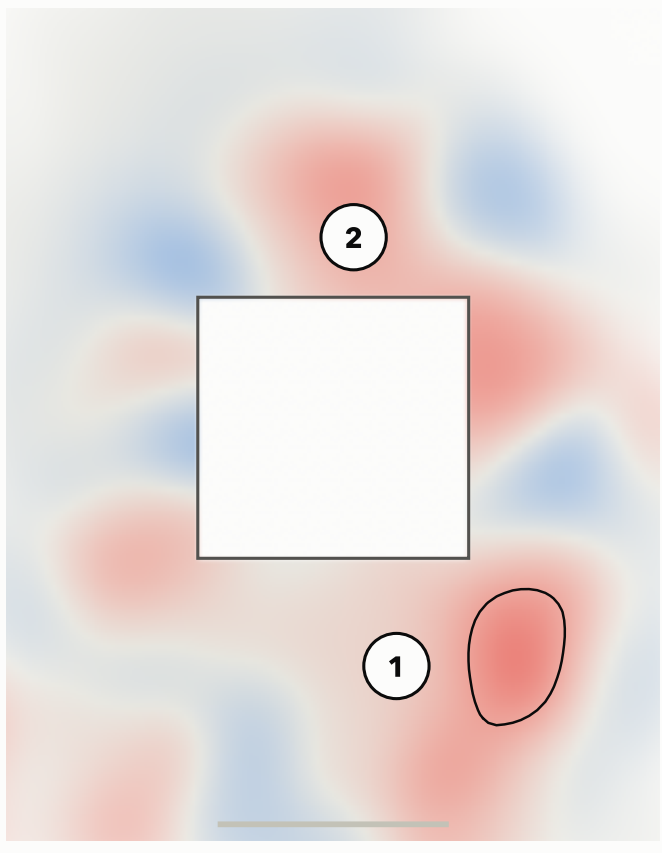

1. Red is where you swing at balls more than other hitters do at the same spot and in the same count. Blue is where you take more than they do. Gray is about average. White means you haven't seen enough pitches there to say.
2. The box is your strike zone, seen from the catcher. The line under it is home plate. Everyone chases more with two strikes, so the comparison is always with hitters in the same count. Nobody is judged for a two-strike swing everyone makes.
3. The numbers on the pictures are your biggest leaks, ranked by what your swing choices cost over a full season. Each plan line is tagged with its leak's number.
4. The plan is one pitch per line, numbered 1 and 2 in the order to work on them: a take before two strikes comes first, because it costs nothing in strikeouts. A take rule is for the pitch that is clearly a ball; each line says how far off the plate the ones you swung at were, and a pitch that was mostly borderline is one to go over on video with your coaches, not a take. Keep swinging at strikes.
5. The target covers every leak on the card, together, in points above the league's chase rate. Everyone's worst spots look better the next season by themselves, and that is the numbers settling, not you improving. The second number is where you would land doing nothing. Under it is a fix. Matching it is not.
6. The cost of far-off chases is what your choices on pitches at least 4 inches off the plate cost over 600 plate appearances, compared with an average hitter. Hitters who cut their leak chasing mostly stopped losing runs; the walks come first, the hits come later if they come.
