Luis García

Bats left · 2026 · 543 PA · xChase+ 86, 225th of 261

Swings at 38% of pitches outside the zone. Hitters on average swing at 30% of the same pitches.

COST OF FAR-OFF CHASES

8.4

runs per 600 PA from your choices on pitches 4+ inches off the plate

What to work on

- Your chase choices cost 15 runs a season, across every count; the two pitches below are the biggest pieces of it. Start with the first.

(1) When you're ahead in the count, let fastballs above the zone go. You swung at 79% of them; hitters on average swing at 21%. The ones you swung at were typically 5 inches off the zone.

(3) When you're ahead against right-handers, let breaking balls below the zone go. You swung at 43% of them; hitters on average swing at 33%. The ones you swung at were typically 5 inches off the zone.

Keep swinging at strikes. The only changes on this card are the pitches above.

TARGET

In these spots you chased 14 points above the league in 2026. Those spots get better on their own, so with no change you'd be about 6 in 2027. Under 6 is a fix.

Where you chase, all pitchers

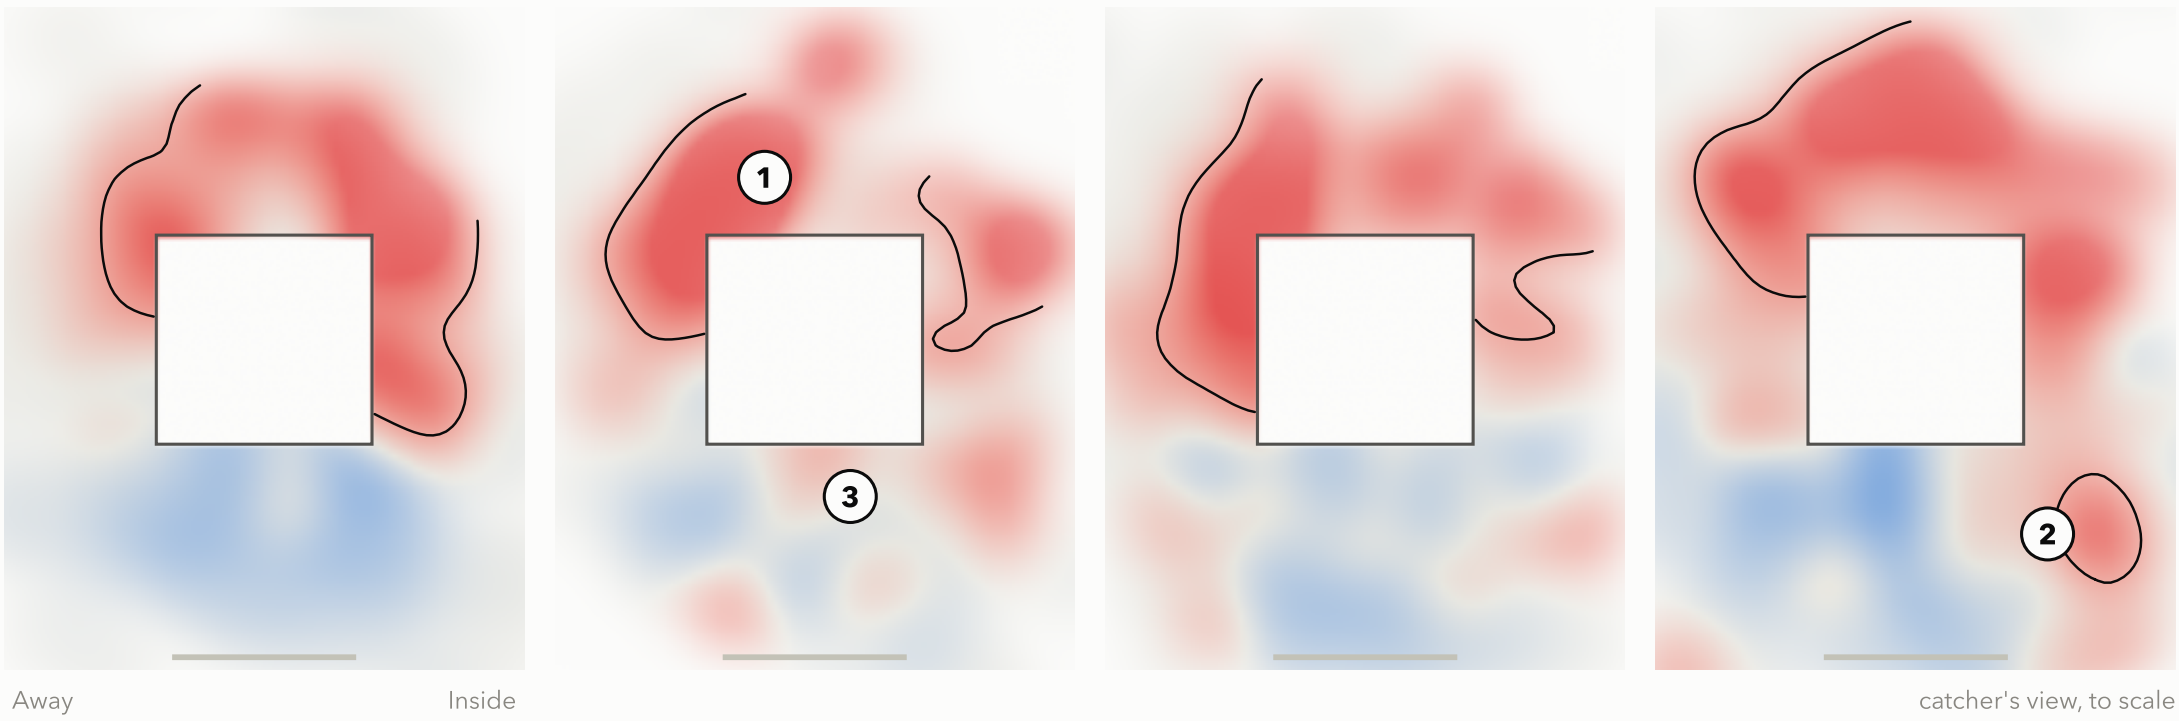

red: more than the average hitter at that spot and count; blue: less

Biggest leaks

numbered on the pictures · runs per 600 PA

(1)	Ahead in the count, fastballs above the zone	79% vs 21% · 11 of 14	**−1.2**
(2)	Two strikes vs RHP, breaking balls down and in	34% vs 21% · 11 of 32	**−1.1**
(3)	Ahead in the count vs RHP, breaking balls below the zone	43% vs 33% · 12 of 28	**−1.0**

You vs the average hitter on the same pitches; the runs are what the swing choices cost. Ranked by runs; the plan is in the order to work on them.

Far-off chase rate by season

Pitches at least 4 inches off the plate: you against every hitter.

Chases vs the average hitter, same spot and count

−30 pts · league · +30 pts

Blue: you take more. Red: you chase more. Gray: about average.
White: too few pitches to say. Outline: 15 points or more.

Does fixing a leak pay? Hitters who cut their leak chasing more than expected stopped giving counts away: more walks, no more strikeouts, still swinging at strikes. The gain was mostly runs not lost; hits come later, if they come.

Swings at 38% of pitches outside the zone. Hitters on average swing at 30% of the same pitches.

COST OF FAR-OFF CHASES

8.4

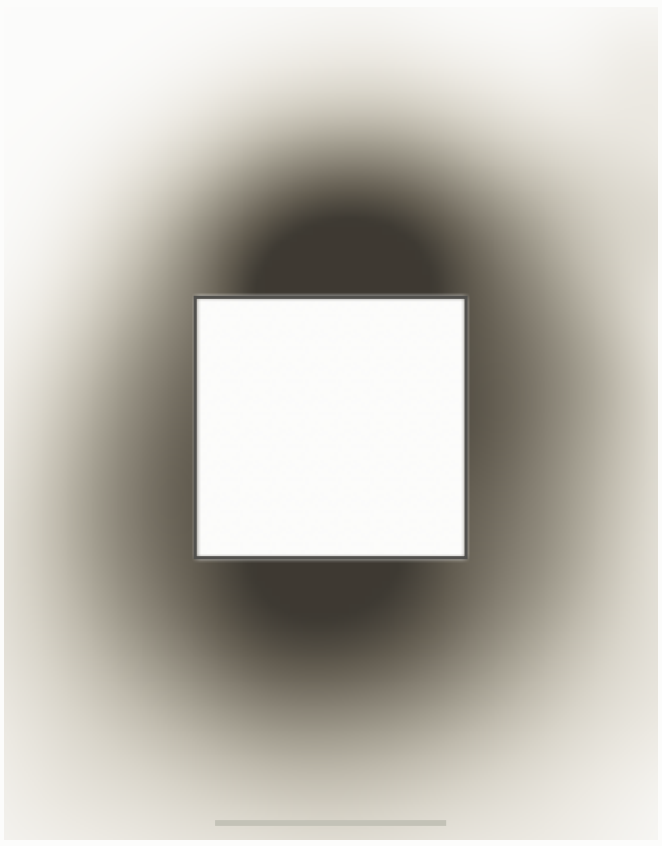

runs per 600 PA from your choices on pitches 4+ inches off the plate

How to read your card

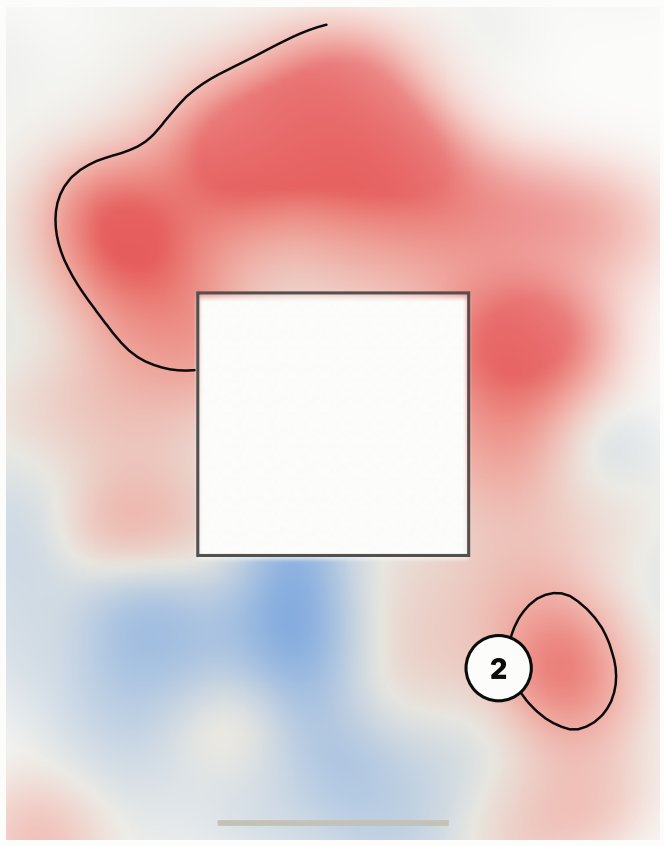

1. Red is where you swing at balls more than other hitters do at the same spot and in the same count. Blue is where you take more than they do. Gray is about average. White means you haven't seen enough pitches there to say.
2. The box is your strike zone, seen from the catcher. The line under it is home plate. Everyone chases more with two strikes, so the comparison is always with hitters in the same count. Nobody is judged for a two-strike swing everyone makes.
3. The numbers on the pictures are your biggest leaks, ranked by what your swing choices cost over a full season. The plan's lines carry the same numbers.
4. The plan is one pitch per line, in the order to work on them: a take before two strikes comes first, because it costs nothing in strikeouts. A take rule is for the pitch that is clearly a ball; each line says how far off the plate the ones you swung at were, and a pitch that was mostly borderline is marked as one for the video room, not a take. Keep swinging at strikes.
5. The target: everyone's worst spots look better the next season by themselves, and that is the numbers settling, not you improving. The second number is where you would land doing nothing. Under it is a fix. Matching it is not.
6. The cost of far-off chases is what your choices on pitches at least 4 inches off the plate cost over 600 plate appearances, compared with an average hitter. Hitters who cut their leak chasing mostly stopped losing runs; the walks come first, the hits come later if they come.
