Jeremy Peña

Bats right · 2026 · 483 PA · xChase+ 76, 252nd of 261

Swings at 40% of pitches outside the zone. Hitters on average swing at 31% of the same pitches.

COST OF FAR-OFF CHASES

8.8

runs per 600 PA from your choices on pitches 4+ inches off the plate

What to work on

1. With two strikes, let fastballs above the zone go. You swung at 78% of them; hitters on average swing at 52%. The ones you swung at were typically 5 inches off the zone.
2. At 0-1 or 1-1, mostly against right-handers, breaking balls below the zone are one to go over on video with your coaches, not a take rule. You swung at 84% of them; hitters on average swing at 41%. The ones you swung at were typically under 4 inches off the zone, too close for a take rule. In this count your chases pay for themselves overall (contact +3.1 against choices −2.2 in the count table); this pitch is where they don't: it costs about 1 run, and what you hit on these chases loses a little more.

- Leak 2 (two strikes, mostly vs RHP, breaking balls away) costs more than line 2, but the ones you swung at were typically under 4 inches off the zone: one to go over on video with your coaches. Your choices also cost about 3 runs a season on the first pitch and 3 when you're ahead in the count, spread over many pitches rather than one take.

Keep swinging at strikes. The change to start with is the first pitch above; the staff takes the second to video with you first.

leak 1

leak 3

TARGET

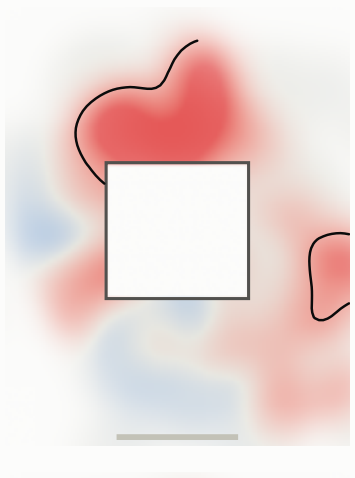

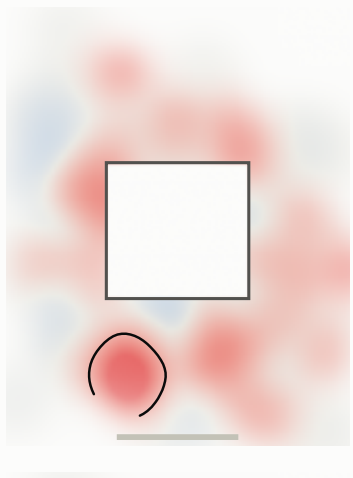

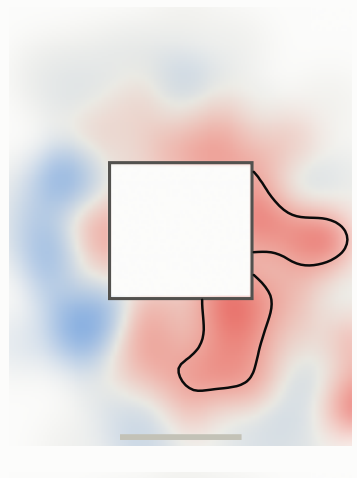

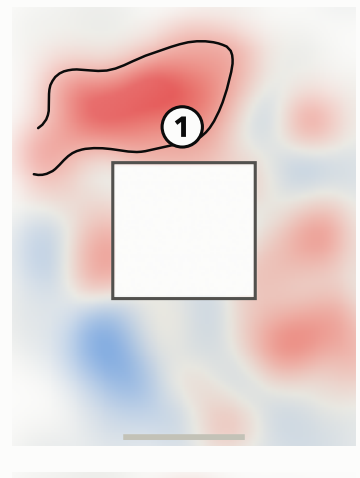

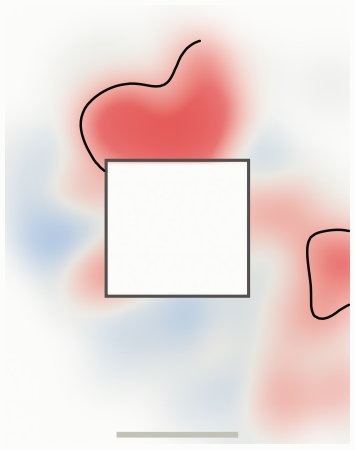

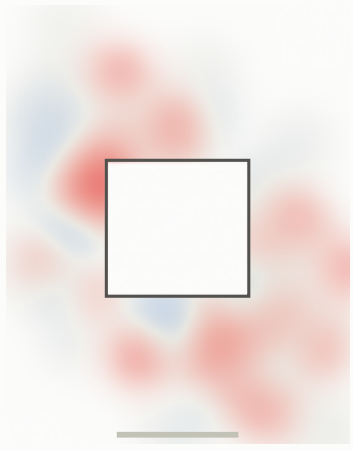

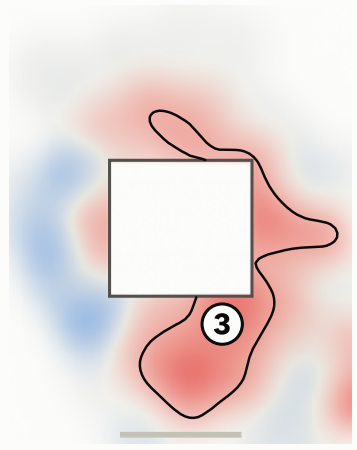

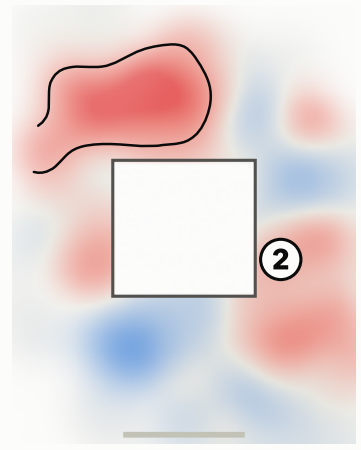

Leaks 1 to 3 together: you chased 30 points above the league's chase rate in 2026. Those spots get better on their own, so with no change you'd be about 18 points above it in 2027. Under 18 is a fix.

COACH'S NOTE, FOR THE STAFF

With two strikes, fastballs above the zone: the plan's first line and the one clear take on his card. His contact pays for most of his chases on fastballs above the zone, so keep him swinging at strikes at the top of it. The two-strike breaking ball away (mostly sliders) and the breaking ball below the zone at 0-1 or 1-1, both mostly from right-handers, were typically under 4 inches off the zone: video items, not take rules.

Where you chase

−30 pts league +30 pts

	First pitch (0-0)	Ahead in the count (1-0 2-0 3-0 2-1 3-1)	0-1 or 1-1 (even or behind)	Two strikes (0-2 1-2 2-2 3-2)
All pitchers				
vs RHP right-handed pitchers				

Inside Away catcher's view, to scale

Red: you chase more than the average hitter at that spot and count. Blue: you take more. Gray: about average. White: too few pitches to say. Outline: 15 points or more over.

Biggest leaks

numbered on the pictures · runs per 600 PA

1	Two strikes, fastballs above the zone	78% vs 52% · 35 of 45	**−2.6**
2	Two strikes, mostly vs RHP, breaking balls away	84% vs 50% · 27 of 32	**−1.8**
3	0-1 or 1-1, mostly vs RHP, breaking balls below the zone	84% vs 41% · 21 of 25	**−1.4**

You vs the average hitter on the same pitches; the runs are what the swing choices cost. Ranked by runs; the plan takes up to two, in the order to work on them.

How to read your card

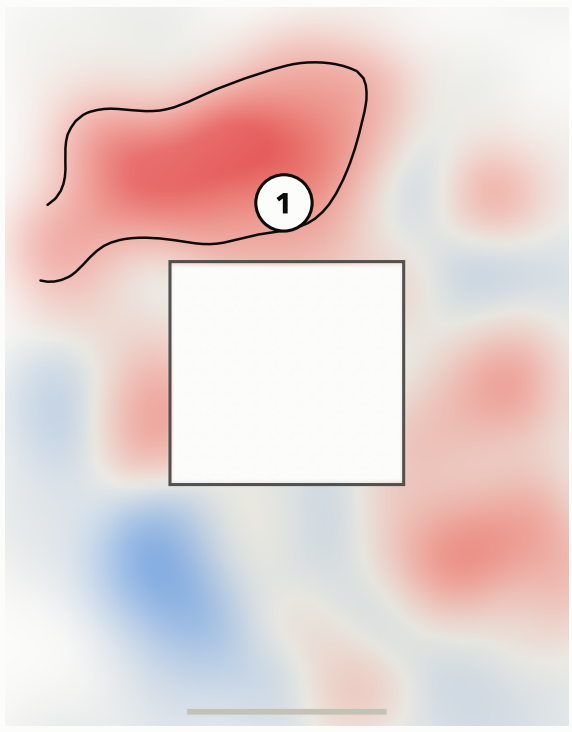

1. Red is where you swing at balls more than other hitters do at the same spot and in the same count. Blue is where you take more than they do. Gray is about average. White means you haven't seen enough pitches there to say.
2. The box is your strike zone, seen from the catcher. The line under it is home plate. Everyone chases more with two strikes, so the comparison is always with hitters in the same count. Nobody is judged for a two-strike swing everyone makes.
3. The numbers on the pictures are your biggest leaks, ranked by what your swing choices cost over a full season, each on the row of pictures its pitches are in (a leak against right-handers is on the vs RHP row). Each plan line is tagged with its leak's number.
4. The plan is one pitch per line, numbered 1 and 2 in the order to work on them: a take before two strikes comes first, because it costs nothing in strikeouts, when you have seen enough of those pitches to trust the number, unless your coaches picked where to start. A line under them names a bigger leak or a costly count that comes later. A take rule is for the pitch that is clearly a ball; each line says how far off the plate the ones you swung at were, and a pitch that was mostly borderline is one to go over on video with your coaches, not a take. Keep swinging at strikes.
5. The target covers every leak on the card, together, in points above the league's chase rate. Everyone's worst spots look better the next season by themselves, and that is the numbers settling, not you improving. The second number is where you would land doing nothing. Under it is a fix. Matching it is not.
6. The cost of far-off chases is what your choices on pitches at least 4 inches off the plate cost over 600 plate appearances, compared with an average hitter. Hitters who cut their leak chasing mostly stopped losing runs; the walks come first, the hits come later if they come.

What normal looks like, with two strikes

You vs the average hitter

−30 pts league +30 pts

The average hitter chases most with two strikes, below and away. Your card only shows where you differ from that.

Far-off chase rate by season

Pitches at least 4 inches off the plate: you against every hitter.

Does fixing a leak pay? Hitters who cut their leak chasing more than expected stopped giving counts away: more walks, no more strikeouts, still swinging at strikes. The gain was mostly runs not lost; hits come later, if they come.
