Swings at 38% of pitches outside the zone. Hitters on average swing at 30% of the same pitches.

COST OF FAR-OFF CHASES

8.4

runs per 600 PA from your choices on pitches 4+ inches off the plate

What to work on

1. When you're ahead in the count, let fastballs above the zone go. You swung at 79% of them; hitters on average swing at 21%. The ones you swung at were typically 5 inches off the zone. Only 14 of these pitches so far, a small sample: go over them on video with your coaches before you make it a rule. — leak 1
2. When you're ahead, mostly against right-handers, let breaking balls below the zone go. You swung at 43% of them; hitters on average swing at 33%. The ones you swung at were typically 5 inches off the zone. — leak 3

- Your chase choices cost 15 runs a season, across every count; the two pitches above are two of the pieces, the ones to work on first.

Keep swinging at strikes. The changes to start with are the pitches above.

TARGET

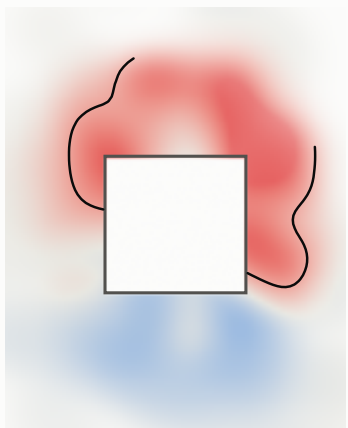

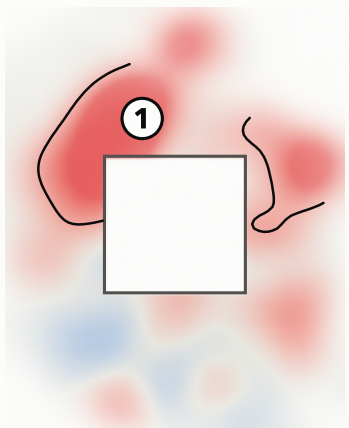

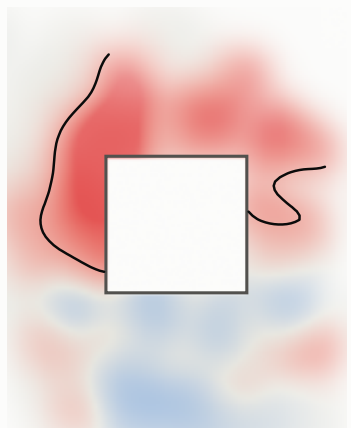

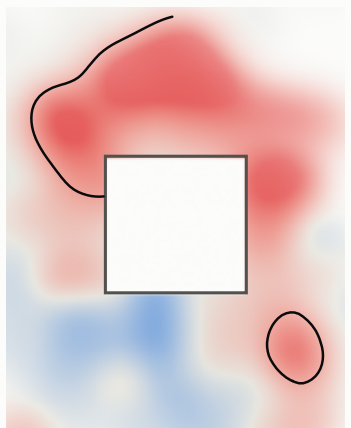

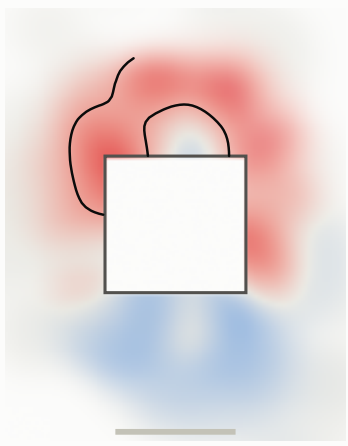

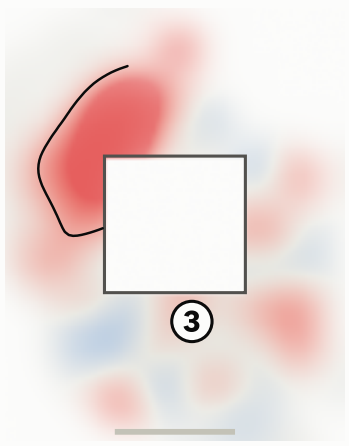

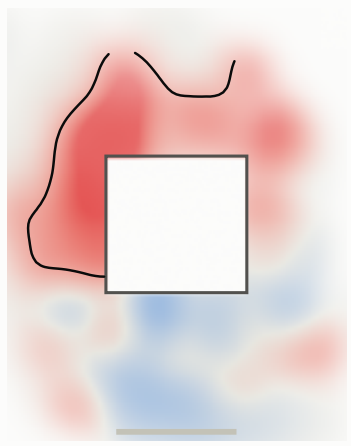

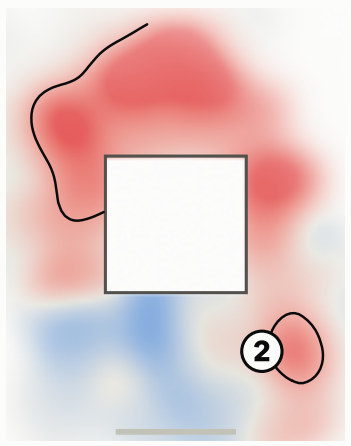

Leaks 1 to 3 together: you chased 14 points above the league's chase rate in 2026 (20 on the rows above; the target uses a simpler league rate, the one it is scored on). Those spots get better on their own, so with no change you'd be about 6 points above it in 2027. Under 6 is a fix. These rates are measured against the ABS box set from your height, not the zone of the seasons before.

COACH'S NOTE, FOR THE STAFF

When he is ahead in the count, fastballs above the zone: the plan's first line, on 14 pitches so far. Three-ball counts sit inside it and in the 3-2 part of 'Two strikes', and with three balls his choices cost about 5 runs per 600 PA; the card cannot show those counts on their own yet, so swinging only at strikes there is the staff's rule to add, not the card's. With two strikes he chases nine fastballs above the zone in ten, but his contact there pays for it, so don't coach that one.

Where you chase

−30 pts league +30 pts

	First pitch (0-0)	Ahead in the count (1-0 2-0 3-0 2-1 3-1)	0-1 or 1-1 (even or behind)	Two strikes (0-2 1-2 2-2 3-2)
All pitchers				
vs RHP right-handed pitchers				

Away Inside — catcher's view, to scale

Red: you chase more than the average hitter at that spot and count. Blue: you take more. Gray: about average. White: too few pitches to say. Outline: 15 points or more over.

Biggest leaks

numbered on the pictures · runs per 600 PA

1	Ahead in the count, fastballs above the zone	79% vs 21% · 11 of 14	**−1.2**
2	Two strikes vs RHP, breaking balls down and in	34% vs 21% · 11 of 32	**−1.1**
3	Ahead in the count, mostly vs RHP, breaking balls below the zone	43% vs 33% · 12 of 28	**−1.0**

You vs the average hitter on the same pitches; the runs are what the swing choices cost. Ranked by runs; the plan takes up to two, in the order to work on them.

How to read your card

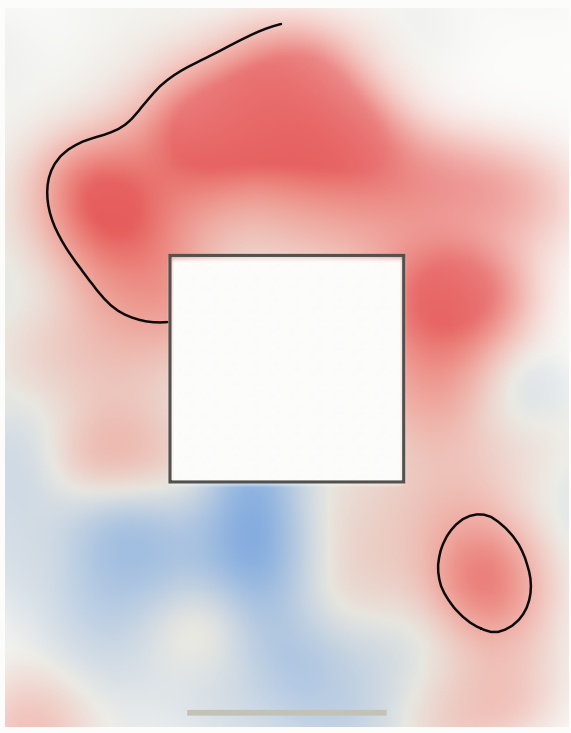

1. Red is where you swing at balls more than other hitters do at the same spot and in the same count. Blue is where you take more than they do. Gray is about average. White means you haven't seen enough pitches there to say.
2. The box is your strike zone, seen from the catcher. The line under it is home plate. Everyone chases more with two strikes, so the comparison is always with hitters in the same count. Nobody is judged for a two-strike swing everyone makes.
3. The numbers on the pictures are your biggest leaks, ranked by what your swing choices cost over a full season, each on the row of pictures its pitches are in (a leak against right-handers is on the vs RHP row). Each plan line is tagged with its leak's number.
4. The plan is one pitch per line, numbered 1 and 2 in the order to work on them: a take before two strikes comes first, because it costs nothing in strikeouts, when you have seen enough of those pitches to trust the number, unless your coaches picked where to start. A line under them names a bigger leak or a costly count that comes later. A take rule is for the pitch that is clearly a ball; each line says how far off the plate the ones you swung at were, and a pitch that was mostly borderline is one to go over on video with your coaches, not a take. Keep swinging at strikes.
5. The target covers every leak on the card, together, in points above the league's chase rate. Everyone's worst spots look better the next season by themselves, and that is the numbers settling, not you improving. The second number is where you would land doing nothing. Under it is a fix. Matching it is not.
6. The cost of far-off chases is what your choices on pitches at least 4 inches off the plate cost over 600 plate appearances, compared with an average hitter. Hitters who cut their leak chasing mostly stopped losing runs; the walks come first, the hits come later if they come.

What normal looks like, with two strikes

You vs the average hitter

−30 pts league +30 pts

The average hitter chases most with two strikes, below and away. Your card only shows where you differ from that.

Far-off chase rate by season

Pitches at least 4 inches off the plate: you against every hitter.

Does fixing a leak pay? Hitters who cut their leak chasing more than expected stopped giving counts away: more walks, no more strikeouts, still swinging at strikes. The gain was mostly runs not lost; hits come later, if they come.
